

# Daylighting solutions with QMotion

The concept of daylighting is becoming increasingly important these days. It asks the question, why block the outside light with shades and then turn on the lights inside? In order to use natural light to brighten a room, but also use shading for managing the light and privacy, QMotion offers a range of tools.

## □ Fabric Selections

Choose from a wide range of screen fabrics with many different features. When trying to allow entering light, lighter colors work better. When glare is an issue, darker colors are the way to go. For more accurate details, see the Tv factor on the specifications for the screen fabrics. The lower Tv ratings have a greater “view-through” and the higher Tv allow more light to pass through.

## □ Timer Controls

The QMotion Timer Remote has a built-in Astronomical clock, which learns sunrise and sunset times for a location, and can be set to adjust shade positioning based on the position of the sun. Convenient and affordable, the Timer Remote can make six adjustments per day, on any or all days of the week.

## □ Individual Controls

Because of the unique Manual Override feature, as well as individual remote controls, each Qadvanced shade may be controlled individually. This is convenient and allows a more customized experience based on the needs of the occupants.

## □ System Controls

With the combination of shades and a Qconnect into a building automation system, Qadvanced shades may be raised or lowered in conjunction with the automation systems, allowing for greater control of lights and HVAC. Imagine raising the shades and turning the lights brighter when the solar light is not enough to illuminate the room.

Daylighting with QMotion is a snap.
